Pantoprazole is a proton pump inhibitor drug used for short-term treatment of erosion and ulceration of the stomach. Mechanism of action. Pantoprazole is a proton pump inhibitor (PPI) that suppresses the final step in gastric acid production by covalently binding to the (H+, K+)-ATPase enzyme system at the secretory surface of the gastric parietal cell. This effect leads to inhibition of both basal and stimulated gastric acid secretion, irrespective of the mechanism of action. Pantoprazole is a substituted benzimidazole derivative indicated for the short-term treatment (up to 16 weeks) of erosive esophagitis associated with gastroesophageal reflux disease (GERD), maintenance of healing of erosive esophagitis, and pathologic hypersecretory conditions including Zollinger-Ellison syndrome. Some common side effects include diarrea, headache, nausea, and abdominal pain. Other drugs in the same class include lansoprazole (Prevacid), omeprazole (Prilosec). Domperidone: N/A; Duration of Action: Pantoprazole: 4 hours; Domperidone: N/A; Half Life of Par Domperidone: N/A; Side. Eur J Gastroenterol Hepatol. 1996 Oct;8 Suppl 1:S15-20. Pantoprazole, a new proton-pump inhibitor, has a predictable profile of activity. Persons ME(1). Author information: (1)Biosciences Division, University of Hertfordshire, Hatfield, UK. MECHANISM OF ACTION OF PANTOPRAZOLE: Pantoprazole is a new, Pantoprazole, first sold under the brand name Protonix, is used for short-term erosive esophagitis associated with gastroesophageal reflux disease (GERD), maintenance of healing of erosive esophagitis, and pathologic hypersecretory conditions including Zollinger-Ellison syndrome. Some common side effects include diarrhea, headache, nausea, and abdominal pain. Other drugs in the same class include lansoprazole (Prevacid), omeprazole (Prilosec).
ACTION OF PANTOPRAZOLE: Pantoprazole is a new, 4 Mar 2018. Pantoprazole (Protonix) is used to treat erosive esophagitis and other conditions involving excess acid. Includes pantoprazole side effects, interactions and. About Pantoprazole + Domperdone: N/A; Mechanism of Action of Pantoprazole + Domperdone: N/A; Pharmacokinetics of Pantoprazole + Domperdone: N/A; Onset of Action for Pantoprazole + Domperdone: N/A; Duration of Action for Pantoprazole + Domperdone: N/A; Half Life of Pantoprazole + Domperdone: N/A; A Side. Substituted benzimidazoles have a similar clinical effect to the standard treatment (up to 16 weeks) in the healing and symptomatic relief of erosive esophagitis. Pantoprazole is a proton pump inhibitor (PPI) that suppresses the final step in gastric acid production. Mechanism of Action. Pantoprazole is a proton pump inhibitor. Dec 22, 2017 - Learn about Protonix (Pantoprazole) - may treat, uses, dosage, side effects, drug interactions, warnings, patient.

Pantoprazole is in a class of drugs called proton pump inhibitors (PPIs), which block the production of acid by the stomach. Other drugs in the same class include lansoprazole (Prevacid), omeprazole (Prilosec) and .\n
Pantoprazole is used to treat erosive esophagitis and other conditions involving excess stomach acid.

Includes pantoprazole side effects, interactions and indications. Pantoprazole, first sold under the brand name Protonix, is used for short-term treatment of erosive esophagitis associated with gastroesophageal reflux disease (GERD), maintenance of healing of erosive esophagitis, and pathological hypsecretory conditions including Zollinger–Ellison syndrome. Some common side effects:

- Headache
- Dizziness
- Abdominal pain
- Diarrhea

Pantoprazole is a proton pump inhibitor (PPI) that suppresses the final step in gastric acid production by covalently binding to the (H+, K+)-ATPase enzyme system at the secretory surface of the gastric parietal cell. This effect leads to inhibition of both basal and stimulated gastric acid secretion, irrespective of the stimulus.

Mechanism of action of pantoprazole:

- **Action**: Pantoprazole is a proton pump inhibitor that suppresses the final step in gastric acid production by covalently binding to the (H+, K+)-ATPase enzyme system at the secretory surface of the gastric parietal cell. It leads to inhibition of both basal and stimulated gastric acid secretion, irrespective of the stimulus.

- **Indications**:
  - Short-term treatment of erosive esophagitis associated with gastroesophageal reflux disease (GERD), maintenance of healing of erosive esophagitis, and pathological hypsecretory conditions including Zollinger–Ellison syndrome.

- **Mechanism of Action**: Pantoprazole inhibits the final step in gastric acid production by covalently binding to the (H+, K+)-ATPase enzyme system at the secretory surface of the gastric parietal cell. This effect leads to inhibition of both basal and stimulated gastric acid secretion, irrespective of the stimulus.

- **Posology**:
  - The dose recommended is 20 mg of pantoprazole (un comprimé) by mouth.
  - The mode of administration for each dosage form are:
    - Oral tablets (10 mg and 40 mg)
    - Capsules (20 mg)
    - Delayed-release capsules (20 mg)
    - Delayed-release tablets (20 mg)

- **Dosage**:
  - The dose recommended is 20 mg of pantoprazole (un comprimé) by mouth.

- **Schedule**:
  - Once daily

- **Duration**:
  - Up to 8 weeks

- **Adjustment**:
  - For patients with impaired renal function:
    - Requires no adjustment
  - For patients with hepatic impairment:
    - Requires no adjustment

- **Adverse Effects**:
  - Common:
    - Headache
    - Dizziness
    - Abdominal pain
    - Diarrhea
  - Less common:
    - Constipation
    - Nausea
    - Vomiting
    - Flatulence
    - Dyspepsia

- **Contraindications**:
  - Hypersensitivity to pantoprazole
  - Inability to swallow tablets or capsules

- **Precautions**:
  - Monitor electrolyte levels in patients with conditions that may alter electrolyte levels (e.g., sepsis, dehydration, malnutrition).
  - Monitor for signs of severe hepatic impairment in patients with pre-existing liver disease.

- **Drug Interactions**:
  - PPIs can affect the absorption of certain medications. Consult a pharmacist for specific interactions.
  - Avoid concurrent use with other PPIs.

- **Overdose**:
  - Symptoms include: abdominal pain, nausea, vomiting, and diarrhea. Treatment should include supportive care.

- **Pregnancy and Lactation**:
  - Use of pantoprazole during pregnancy and lactation should be avoided.

- **Additional Information**:
  - Pantoprazole is not recommended for long-term use. Long-term use may increase the risk of histologic atrophy of the gastric mucosa and decreased gastric acid production.
  - Pantoprazole should not be used in children under 18 years of age.
